

## Milestone 1

### Accomplished:

- Created basic app skeleton
- Created initial home page
  - Simply has a title and shows any review that the user posts
- Created review page
  - User is allowed to type a 200 character review, pick a bar from a preset list using a Picker, and select a star rating
  - The star rating feature works now by allowing user to tap on any of the 5 stars and have it update correctly
  - Users can then either hit the submit review button or cancel.
    - Submit button: Adds the review (bar, description, star rating) to the home screen in a list format
    - Cancel button: Clears the text review box
- Created two tabs to switch between home and review page

We are on track according to our schedule.
